Description	Originally spotted by Larry Lewis. Small white tern, slightly larger than tree swallow with distinct yellow bill with black tip.

Behavior (be as detailed as possible about what the bird was doing)

Originally single bird flying with rapid wing beats throughout reservoir with second bird located at approximately 12:49. Birds flying approximately 30' above water surface and then descending to surface. Single least tern fluttered and almost landed on buoys located approximately 20' offshore in front of me and then departed. Later, both terns landed on buoys and photos were obtained. At one point, one least tern was flying rapidly above water surface chased by tree swallow.

Separation from similar species (How you eliminated others)

Yellow bill ruled out common and Forster's tern. Much smaller size and smaller yellow bill compared to large-billed tern.

Are you positive of your identification ? (Why or why not)

Yes, due to previous experience viewing least tern on NJ beaches and identification of pertinent field marks
